

# Bases de l'auto-immunité

## Panorama et physiopathologie des maladies auto-immunes

Luc Mouthon

Service de Médecine Interne, hôpital Cochin,

Centre de Référence Maladies Systémiques Autoimmunes et  
Autoinflammatoires Rares d'Ile de France, de l'Est et de l'Ouest

Assistance publique-Hôpitaux de Paris, Paris

INSERM UMRS 1138, Centre de Recherche des Cordeliers, Paris

# Conflicts of interest

- **Consultant:** Boehringer, LFB Biotechnologies
- **Investigator:** Abbvie, Boehringer
- **Financial support (grants):** CSL Behring, LFB Biotechnologies

# Maladie auto-immune: définition

- Les **maladies auto-immunes** sont dues à une hyperactivité du système immunitaire à l'encontre de substances ou de tissus qui sont normalement présents dans l'organisme.
- Parmi ces maladies on trouve **la sclérose en plaques, le diabète de type 1** (jadis appelé « diabète juvénile » ou « diabète insulino-dépendant »), le **lupus** systémique, les thyroïdites auto-immunes, la **polyarthrite rhumatoïde**, etc....

## 2 grands types de maladies auto-immunes (MAI)

*La physiopathologie n'est certainement pas la même !*

# Maladies-vedettes: maladies systémiques

- Connectivites

Lupus  
systémique

Sclérodémie  
systémique

Sjögren

Myosites

- Vascularites

Horton

Périartérite  
noueuse

Wegener

Polyangéite  
microscopique

Churg  
Strauss

- Granulomatoses

Sarcoïdose

# Criteria for the definition of autoimmune diseases

## ➤ Direct evidence

**Direct transfert of the disease** from human to human or from a human to an animal (the recipient's immune system must be functional).

## ➤ Indirect evidence

**Animal models** identical or very close to disease manifestations observed in humans.

## ➤ Circumstantial evidence

**Clinical or experimental data** underlying the autoimmune nature of a disease in the absence of definite proof (characterization of an antigen specific autoimmune reaction, activation of T lymphocytes in culture in the presence of an autoantigen).

# Immune thrombocytopenic purpura: the proof!

IMMUNOLOGIC MECHANISMS IN IDIOPATHIC AND  
NEONATAL THROMBOCYTOPENIC PURPURA \*

By WILLIAM J. HARRINGTON, M.D.,† *St. Louis, Missouri*, CHARLES  
C. SPRAGUE, M.D., *New Orleans, Louisiana*, VIRGINIA MINNICH,  
M.S., CARL V. MOORE, M.D., F.A.C.P., ROBERT C. AULVIN, B.S.,  
and REUBENIA DUBACH, Ph.D., *St. Louis, Missouri*

Effect of the patient's total blood FC on a healthy subject

| Date     | Patient F. C.                                      |                          | Recipient W. H. **Shimon Sakaguchi**

Prize share: 1/3

Mary E. Brunkow, Fred Ramsdell and Shimon Sakaguchi shared the Nobel prize **for their work on peripheral immune tolerance, a process that is key to organ transplants and treatment of autoimmune diseases**

# Immunologic self-tolerance maintained by activated T cells expressing IL-2 receptor alpha-chains (CD25). Breakdown of a single mechanism of self-tolerance causes various autoimmune diseases

CD4+CD25+ cells contribute to maintaining self-tolerance by down-regulating immune response to self and non-self Ags in an Ag-nonspecific manner, presumably at the T cell activation stage; **elimination/reduction of CD4+CD25+ cells relieves this general suppression, thereby not only enhancing immune responses to non-self Ags, but also eliciting autoimmune responses to certain self-Ags. Abnormality of this T cell-mediated mechanism of peripheral tolerance can be a possible cause of various autoimmune diseases.**

# The regulation and differentiation of regulatory T cells and their dysfunction in autoimmune diseases

**Fig. 1 |. FOXP3-centred gene regulatory network: epigenetic modulation of  $T_{reg}$  cell function and stability.**

# Females are more susceptible to autoimmune diseases than males

Fig. 1. Gender and autoimmune disease. Numbers refer to total number of cases (x 1,000,000) in the US.

# Xist ribonucleoproteins promote female sex-biased autoimmunity

# Xist ribonucleoproteins promote female sex-biased autoimmunity

- Autoimmune diseases disproportionately affect females.
- Xist long non-coding RNA (lncRNA) is expressed only in females to randomly inactivate one of the two X chromosomes to achieve gene dosage compensation.
- The Xist ribonucleoprotein (RNP) complex is an important driver of sex-biased autoimmunity.
- Inducible transgenic expression of a non-silencing form of Xist in male mice introduced Xist RNP complexes and sufficed to produce autoantibodies.
- Male SJL/J mice expressing transgenic Xist developed more severe multi-organ pathology in a pristane-induced lupus model than wild-type males.
- Xist expression in males reprogrammed T and B cell populations and chromatin states to more resemble wild-type females.
- Human patients with autoimmune diseases displayed significant autoantibodies to multiple components of XIST RNP.
- Thus, a sex-specific lncRNA scaffolds ubiquitous RNP components to drive sex-biased immunity.

# Autoimmune disease patients experience increased serum reactivity toward antigens of the XIST RNP

(C) Volcano plot of serum reactivity of sera grouped by DM, SSc, and SLE patients, compared with general population

(D) Metrics of unique antigens from the array with significant elevated serum activity in autoimmune patients, compared with the general population.

(E) Serum reactivity (MAD) plots of representative antigens significantly reactive in all three autoimmune patient cohorts grouped by disease type and colored by sex (red, female; blue, male).

# Model of XIST RNP in autoimmune progression

# Pattern diagram of some typical autoimmune diseases

**A- Inflammation stimulus**

**C- Increase expression of membrane PR3, activation and cytokines expression**

**B- Endothelial cell activation and expression of adhesion molecule**

**D- PR3 ligation on EC**

**D- Endothelial destruction by ROS**

**E- Increase neutrophil survival**

**E- Th1/Th2  
Th17/Treg  
imbalance**

**E- B cell activation**

**F- Granuloma formation**

## Autoimmune-related adverse events induced by immune checkpoint inhibitors

The Yin and Yang indicate the immune balance between immune activation and tolerance, which could be disrupted by ICIs. Immune checkpoints maintain the immune tolerance by negatively regulating T cell activity, while also enabling tumor evasion. The administration of ICIs shifts the immune landscape toward immune activation, enhancing the antitumor immune response, but also potentially leading to irAEs. Figure designed using [Biorender.com](https://biorender.com). IC: immune checkpoint; MHC: major histocompatibility complex.

# Innovative Horizons in Next-Generation Therapeutic Approaches for Autoimmune Diseases.

# Mechanism of action of monoclonal antibodies targeting FcRn

M281, a fully human, effectorless IgG1 monoclonal antibody binds competitively and with high affinity at pH 6.0 or pH 7.4 to the IgG binding site of FcRn, a transmembrane endosomal receptor for IgG and albumin. M281 has no effect on IgM, IgA, IgE, or cellular response to immunisation.

# CD19 CAR T-Cell Therapy in Autoimmune Disease — A Case Series with Follow-up

- 15 patients with severe SLE (8 patients), idiopathic inflammatory myositis (3 patients), or systemic sclerosis (4 patients) who received a single infusion of CD19 chimeric antigen receptor (CAR) T cells after preconditioning with fludarabine and cyclophosphamide
- In this case series, CD19 CAR T-cell transfer appeared to be feasible, safe, and efficacious in three different autoimmune diseases

**Table 3.** Long-Term Safety of CD19 CAR T-Cell Therapy in Autoimmune Disease.\*

| Patient No. | Disease | <3 Months           | 3–6 Months                             | 6–12 Months         | >12 Months                          |

\* Shown is the infection profile of patients with autoimmune disease undergoing CD19 CAR T-cell therapy. Data are presented chronologically and according to site of infection. RSV denotes respiratory syncytial virus, SARS-CoV-2 severe acute respiratory syndrome coronavirus 2, URTI upper respiratory tract infection, and UTI urinary tract infection.

† The infection was treated with nirmatrelvir–ritonavir (Paxlovid).
